

3. Project Design Phase

ComicCraft - AI Comic Story Creator using Gemini Models

Phase Details

Overall Architecture	ComicCraft uses a frontend, FastAPI backend, AI services and comic layout/export modules.
Frontend Design	HTML, CSS and Jinja2 templates are used for user input, comic preview and export-success pages.
Backend Design	FastAPI handles server-side operations, routing, form data and JSON-based comic generation.
AI Design	Gemini Flash generates a structured five-panel outline; Gemini Pro creates detailed narration and dialogue; Stable Diffusion creates illustrations.
Layout Design	layout_builder.py assembles each panel's title, image and text into a structured comic layout.
Export Design	exporters.py uses FPDF to create the final downloadable comic PDF.

Prepared as a separate phase document for the ComicCraft project.
